使用不同光程比色皿的色度值参数表示方法

本部分默认使用 10 mm 光程比色皿的测定值为标准测定值表示方法。如果使用其他光程比色皿的测定,应换算为 10 mm 光程比色皿的测定值,并在测定参数右下角注明使用的比色皿光程数值。

例 1:使用 10 mm 光程比色皿相关色度值参数的表示方法:

$$L^* 23.4, a^* 22.36, b^* 1.67, C_{ab}^* 2.3, h_{ab} 0.7$$

例 2:使用 5 mm 光程比色皿的测定结果换算为 10 mm 光程比色皿后相关色度值参数的表示方法:

$$L_5^* 23.4, a_5^* 22.36, b_5^* 1.67, C_{ab5}^* 2.3, h_{ab5} 0.7$$

3 Terms and Definitions

For the purposes of this document, the following terms and definitions apply.

3.1 color space

Color space means a three-dimensional space indicating color.

3.2 Uniform Color Space

Refer to a color space which indicates the same color perception difference by the same distance.

3.3 CIE 1976 ($L^* a^* b^*$) Color Space (CIE LAB Color Space)

Refer to a uniform color space recommended by CIE in 1976, which is a three-dimensional rectangular coordinates system.

3.4 Color Difference

Mean quantitative representation of color difference, which is expressed by ΔE .

3.5 Lightness

Stand for the visual perception characteristic value of the lightness of object surface color, and the gradation is determined using absolute white and absolute black as the benchmark, which is one of three attributes of color.

3.6 Curoma

Adopt the distance iso-lightness achromatic visual perception characteristics to indicate the color intensity of object surface, and determine the gradation, which is one of three attributes of color.

3.7 Hue

Indicate attributes of red, yellow, green, blue, purple and other colors, which is one of three attributes of color.

3.8 Psychrometric Lightness

In the uniform color space, psychrometric lightness equals to the coordinates of lightness. L^* is defined as CIE 1976 psychrometric lightness in the $L^* a^* b^*$ color space.

3.9 psychrometric chroma coordinates

Refer to two coordinates in the iso-lightness surface in the uniform color space. For example, two coordinates, a^* and b^* in $L^* a^* b^*$ color space.

3.10 Trlstimulos Values

Refer to the measurement of three kinds of reference color stimulus necessary to reach to color matching with colorstimulus to be measured in the trichromatic system. In the CIE 1964 standard chromatic system, use X_{10} , Y_{10} and Z_{10} to indicate the trlstimulos values.

3.11 Color Matching Function

A group of normalized monochromatic radiation tristimulus values for reference color stimulus X_{10} , Y_{10} and Z_{10} necessary to match with each wavelength of equal energy spectrum.

3.12 CIE standard illuminants

A specific spectral power distribution incoming on the object as described by CIE, including average daylight with standard illuminant D_{56} and the related color temperature of 6 504 K;

3.13 CIE 1964 standard Colorimetric Observer

Colorimetric characteristics of CIE 1964 standard colorimetric observer are consistent with the color matching function $\bar{x}_{10}(\lambda)$, $\bar{y}_{10}(\lambda)$ and $\bar{z}_{10}(\lambda)$ in the CIE 1964 standard colorimetric system, which is applicable to visual field scope $>4^\circ$.

3.14 Color Stimulus Function

Spectral concentration expression of color stimulus using radiation measurement such as radiance or radiant power as the wavelength function.

3.15 Relative Color Stimulus Function

Refer to relative spectral power distribution of color stimulus function.

3.16 Spectral Transmittance

Mean the ratio between radial flux or luminous flux $\phi_{t\lambda}$ of the wavelength λ of object transmission and radial flux or luminous flux $\phi_{i\lambda}$ of the wavelength λ incoming on the object surface, and the spectral transmittance is expressed as $\tau(\lambda)$.

3.17 Psychophysical Color Specification

Refer to the measurement of attributes of colour stimulus expressed by the tristimulus values.

4 Abstract of Methods

After purifying samples, measure the absorbance of samples within 380 nm~780 nm wavelength, calculate the integral of relative color stimulus function and color matching function for the absorbance, and then compare integral results with standards tristimulus values to calculate L^* , a^* , b^* values and C_{ab}^* value of chroma as well as h_{ab} value of hue angle.

5 Reagent Materials

5.1 Water: Grade I water as specified in GB/T 6682.

5.2 Methyl alcohol: analytically pure.

6 Instruments and Equipment

6.1 After all instruments contacting samples to be measured are cleaned by water (5.1), residual grease and pigments and other impurities are eliminated using methyl alcohol (5.2), and then dried in the shade for standby application.

6.2 Spectrometer or other color measuring instrument: Spectral scope: 380 nm~780 nm; interval: 5 nm; slit: 2.0; medium speed or low speed; integral time: 2.0.

6.3 Cuvette: Optical glass cuvette with 1.0 mm, 2.0 mm, 5.0 mm, 10 mm and 20 mm optical length;

6.4 Filter film: 0.45 μm watery filter film.

7 Specimen Preparation and Storage

7.1 Specimen Preparation

Sparkle wine needs to be degassed. Pour the wine sample of about 100 mL into a beaker flask with air evacuation valve. Placed the wine in an ultrasonic water tank (or horizontal oscillator) at room temperature after a certain period of time until no gas escapes.

7.2 Purification

Specimens are centrifuged for 10 min at 8 000 r/mtn, and about 10 mL supernatant is taken and then filtered via the filter film for measurement.

7.3 Conditions of Instruments

Select color measuring instrument or spectrometer depending on needs:

a) Measurement (Spectrophotometry)

Set the instrument as required in the instruction, and make blank calibration of the spectrophotometry (6.2) with water (5.1) as the control.

Sample solution is filled into the cuvette for measurement, and read the absorbance value within 380 nm~780 nm with the interval of 5 nm.

b) Measurement (Color Measuring Instrument)

Set instrument parameters as required in the instruction, and make blank calibration of the color measuring instrument (6.2) with water (5.1) as the control.

Sample solution is filled into the cuvette for measurement and apply the software treatment system of the instrument to read chromatic value parameters of CIE 1976 ($L^* a^* b^*$) color space.

8 Calculation and Expression of Results

8.1 As for the CIE 1976 ($L^* a^* b^*$) chromatic value of specimens, directly read the related chromatic value parameters from data treatment software of color measuring instrument (5.1), or after the absorbance value is obtained from the spectrometer, calculate tristimulus values X , Y and Z of specimens in CIE 1964 standard chromatic system as per the formula (2), (3), (4), (5) and (1), and then calculate psychometric lightness L^* and psychometric chroma coordinates a^* and b^* of CIE 1976 ($L^* a^* b^*$) color space as per the formula (6), (7), (8), (9) and (10).

8.2 Calculation Formula of Color Stimulus Function, see formula(1):

$$\varphi(\lambda) = \tau(\lambda) S(\lambda) \quad \dots\dots\dots(1)$$

Where:

$\varphi(\lambda)$ —Color stimulus function in the calculation of tristimulus values for specimens;

$\tau(\lambda)$ —Spectral transmittance of specimens, calculated by the antilog of the absorbance value as per the method specified in GB/T 3979;

$S(\lambda)$ —Relative spectral power distribution factor of CIE standard illuminants, obtained as per D65 as specified in GB/T 3978 (see Table A.1 in the appendix A).

8.3 Calculation Formula of Psychophysical Color Specification, see formula(2)~(5):

$$X = \kappa_{10} \sum_{380}^{780} \varphi(\lambda) \bar{x}_{10}(\lambda) \Delta\lambda \quad \dots\dots\dots(2)$$

$$Y = \kappa_{10} \sum_{380}^{780} \varphi(\lambda) \bar{y}_{10}(\lambda) \Delta\lambda \quad \dots\dots\dots(3)$$

$$Z = \kappa_{10} \sum_{380}^{780} \varphi(\lambda) \bar{z}_{10}(\lambda) \Delta\lambda \quad \dots\dots\dots (4)$$

$$\kappa_{10} = \frac{100}{\sum S(\lambda) \bar{y}_{10}(\lambda) \Delta\lambda} \quad \dots\dots\dots (5)$$

Where:

X —Psychophysical color specification X of specimens;

Y —Psychophysical color specification Y of specimens;

Z —Psychophysical color specification Z of specimens;

$\bar{x}_{10}(\lambda)$ —Color matching function of CIE 1964 standard colorimetric observer (see Table A.1 in the appendix A);

$\bar{y}_{10}(\lambda)$ —Color matching function of CIE 1964 standard colorimetric observer (see Table A.1 in the appendix A);

$\bar{z}_{10}(\lambda)$ —Color matching function of CIE 1964 standard colorimetric observer (see Table A.1 in the appendix A);

κ_{10} —Normalization coefficient;

$\Delta\lambda$ —Wavelength interval in the measurement of specimens, 5 nm.

8.4 Calculation Formula of Chromatic Value, see formula (6) ~ (10):

$$L^* = 116f\left(\frac{Y}{Y_{10}}\right) - 16 \quad \dots\dots\dots (6)$$

$$a^* = 500 \left[f\left(\frac{X}{X_{10}}\right) - f\left(\frac{Y}{Y_{10}}\right) \right] \quad \dots\dots\dots (7)$$

$$b^* = 200 \left[f\left(\frac{Y}{Y_{10}}\right) - f\left(\frac{Z}{Z_{10}}\right) \right] \quad \dots\dots\dots (8)$$

$$C_{ab}^* = [(a^*)^2 + (b^*)^2]^{\frac{1}{2}} \quad \dots\dots\dots (9)$$

$$h_{ab} = \arctan\left(\frac{b^*}{a^*}\right) \quad \dots\dots\dots (10)$$

Where:

- L^* —Psychometric lightness coordinate value of specimens in CIE 1976 ($L^* a^* b^*$) color space (also named lightness value);

- Y_{10} —Psychophysical color specification Y of CIE 1964 standard colorimetric observer (see Table B.1 in the appendix B);
- Z_{10} —Psychophysical color specification Z of CIE 1964 standard colorimetric observer (see Table B.1 in the appendix B).

Lightness L^* shall be not less than 20 during the measurement. If lower than 20, use the cuvette with shorter optical length for re-determination.

Select as per conditions as specified in formula (C.1), (C.2), (C.3), (C.4), (C.5) and (C.6) while calculating as per the formula (6), (7), (8), (9) and (10) (see the appendix C).

This standard takes measuring results of cuvette with 10 mm optical length as the standard expression method. If using measuring results of cuvette with other optical length, they must be converted into measuring values under the standard expression method, and the optical length value of cuvette used shall be marked at the lower right corner of measuring parameters.

Examples of calculation (seen the appendix E).

Results are expressed by the arithmetic mean value of results of two independent measurements under repeatability conditions. Retain one digit after the decimal point for L^* , and two digits after the decimal point for a^* , b^* , C_{ab}^* and h_{ab}^* .

9 Degree of Precision

The chromatic aberration ΔE_{ab} of results of two independent measurements cannot exceed 1.5 under repeatability conditions (For calculation method of chromatic aberration, see the appendix F).

Besides, the optical length value of cuvette used shall be noted at the lower right corner of determination parameter.

Example 1: expressive method of relevant chromatic value parameters using cuvette with 10 mm of optical length:

$$L^* 23.4, a^* 22.36, b^* 1.67, C_{ab}^* 2.3, h_{ab} 0.7$$

Example 2: expressive method of relevant chromatic value parameters using cuvette with 10 mm of optical length converted from determination result of cuvette with 5 mm of optical length:

$$L_5^* 23.4, a_5^* 22.36, b_5^* 1.67, C_{ab52}^* .3, h_{ab50} .7$$
